

stairmaker plugin - u-shape

possible result for an in-situ stair.....?

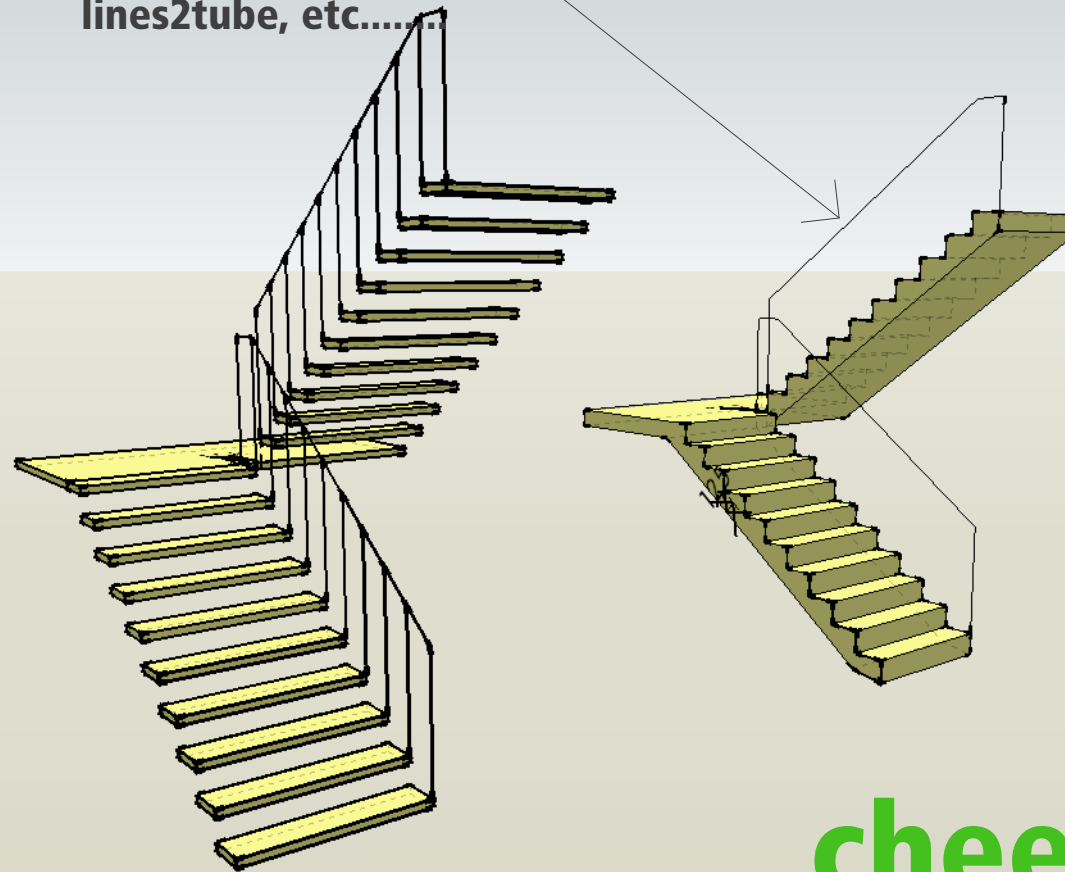

**With in-situ stairs the depth of the 'throat' is determined by design. This also sets the depth of platform if a seamless stair soffit is desired... [see next page...]**

**consistent line of stair soffit  
[builders will love you!!!]**

**This is only achieved by ensuring  
the last tread in the first flight forms  
part of the landing as shown here  
and is in line with the first tread  
in the second flight**

one last thing: is it possible to offer an option for height / offset for the handrail guide as a profile? If so, handrails can be easily completed with plugins such as lines2tube, etc.....

**cheers!!!!**
